- Remarks on the joint pmf
- What is a joint CDF?
- Joint CDFs
- Marginal CDFs
- Remarks on the joint and marginal CDF
- Independence and Conditioning
- What is the conditional pmf?
- Remarks on the conditional pmf
- Conditional pmf's

Learning Objectives

- 1. Calculate probabilities for a pair of discrete random variables
- 2. Calculate and graph a joint, marginal, and conditional probability mass function (pmf)
- 3. Calculate and graph a joint, marginal, and conditional cumulative distribution function (CDF)

What is a joint pmf?

Definition: joint pmf

The **joint pmf** of a pair of discrete r.v.'s \boldsymbol{X} and \boldsymbol{Y} is

$$p_{X,Y}(x,y) = \mathbb{P}(X = x \text{ and } Y = y) = \mathbb{P}(X = x, Y = y)$$

4

This chapter's main example

Example 1

Let X and Y be two random draws from a box containing balls labelled 1, 2, and 3 without replacement.

- 1. Find $p_{X,Y}(x,y)$.
- 2. Find P(X + Y = 3).
- 3. Find P(Y = 1).
- 4. Find $\mathbb{P}(Y \leq 2)$.
- 5. Find the joint CDF $F_{X,Y}(x,y)$ for the joint pmf $p_{X,Y}(x,y)$
- 6. Find the marginal CDFs $F_X(x)$ and $F_Y(y)$
- 7. Find $p_{X|Y}(x|y)$.
- 8. Are X and Y independent? Why or why not?

Joint pmf

Example 1

Let X and Y be two random draws from a box containing balls labelled 1, 2, and 3 without replacement.

- 1. Find $p_{X,Y}(x, y)$.
- 2. Find P(X + Y = 3).

Marginal pmf's

Example 1

Let X and Y be two random draws from a box containing balls labelled 1, 2, and 3 without replacement.

- 3. Find P(Y = 1).
- 4. Find $\mathbb{P}(Y \leq 2)$.

Remarks on the joint pmf

Some properties of joint pmf's:

- A joint pmf $p_{X,Y}(x,y)$ must satisfy the following properties:
 - $p_{X,Y}(x,y) \ge 0$ for all x,y.
 - $\sum_{\{\text{all } x\} \{\text{all } y\}} \sum_{\{\text{pX,Y}(x,y) = 1.}$
- Marginal pmf's:
 - $p_X(x) = \sum_{\{\text{all } y\}} p_{X,Y}(x,y)$

What is a joint CDF?

Definition: joint CDF

The joint CDF of a pair of discrete r.v.'s \boldsymbol{X} and \boldsymbol{Y} is

$$F_{X,Y}(x,y) = \mathbb{P}(X \le x \text{ and } Y \le y) = \mathbb{P}(X \le x, Y \le y)$$

9

Joint CDFs

Example 1

Let X and Y be two random draws from a box containing balls labelled 1, 2, and 3 without replacement.

5. Find the joint CDF $F_{X,Y}(x,y)$ for the joint pmf $p_{X,Y}(x,y)$

Marginal CDFs

Example 1

Let X and Y be two random draws from a box containing balls labelled 1, 2, and 3 without replacement.

6. Find the marginal CDFs $F_X(x)$ and $F_Y(y)$

Remarks on the joint and marginal CDF

- $F_X(x)$: right most columns of the CDf table (where the Y values are largest)
- $F_Y(y)$: bottom row of the table (where X values are largest)

•
$$F_X(x) = \lim_{y \to \infty} F_{X,Y}(x,y)$$

•
$$F_Y(y) = \lim_{x \to \infty} F_{X,Y}(x,y)$$

Independence and Conditioning

Recall that for events A and B,

•
$$\mathbb{P}(A|B) = \frac{\mathbb{P}(A \cap B)}{\mathbb{P}(B)}$$

- A and B are independent if and only if
 - $\blacksquare \ \mathbb{P}(A|B) = \mathbb{P}(A)$
 - $\blacksquare \ \mathbb{P}(A \cap B) = \mathbb{P}(A) \cdot \mathbb{P}(B)$

Independence and conditioning are defined similarly for r.v.'s, since

$$p_X(x) = \mathbb{P}(X = x) \text{ and } p_{X,Y}(x,y) = \mathbb{P}(X = x, Y = y).$$

What is the conditional pmf?

Definition: conditional pmf

The **conditional pmf** of a pair of discrete r.v.'s X and Y is defined as

$$p_{X|Y}(x|y) = \mathbb{P}(X = x|Y = y) = \frac{\mathbb{P}(X = x \text{ and } Y = y)}{\mathbb{P}(Y = y)} = \frac{p_{X,Y}(x,y)}{p_{Y}(y)}$$

if $p_{Y}(y) > 0$.

Remarks on the conditional pmf

The following properties follow from the conditional pmf definition:

- If $X \perp Y$ (independent)
 - $p_{X|Y}(x|y) = p_X(x)$ for all x and y
 - $p_{X,Y}(x,y) = p_X(x)p_Y(y)$ for all x and y
 - Which also implies (\Rightarrow) : $F_{X,Y}(x,y) = F_X(x)F_Y(y)$ for all x and y
- If X_1, X_2, \ldots, X_n are independent

$$p_{X_1,X_2,...,X_n}(x_1,x_2,...,x_n) = P(X_1 = x_1,X_2 = x_2,...,X_n = x_n) = \prod_{i=1}^n p_{X_i}(x_i)$$

$$F_{X_1,X_2,...,X_n}(x_1,x_2,...,x_n) = P(X_1 \le x_1,X_2 \le x_2,...,X_n \le x_n) = \prod_{i=1}^n P(X_i \le x_i) = \prod_{i=1}^n F_{X_i}(x_i)$$

Conditional pmf's

Example 1

Let X and Y be two random draws from a box containing balls labelled 1, 2, and 3 without replacement.

- 7. Find $p_{X|Y}(x|y)$.
- 8. Are X and Y independent? Why or why not?

Remark:

- To show that X and Y are *not* independent, we just need to find one counter example
- However, to show that they are independent, we need to verify this for all possible pairs of x and y
